APPENDIX

Showing Changes Made to the Specification and/or Claims Page 1 of 2

In reference to the amendments made herein, additions appear as underlined text while deletions appear as strikeout text, as indicated below.

1. (Amended) A product comprising:

a substrate having a strain point or a melting point temperature
between about 300°C and 700°C; and

a plurality of substantially aligned carbon nanotubes attached to $\frac{1}{2}$ substrate at a density greater than 10^4 nanotubes per square millimeter of substrate.

- 12. (Amended) A product as claimed in claim $\frac{1}{2}$ 87, wherein the catalyst is a metal or metal alloy and wherein substantially all carbon nanotubes have a cap distal from the substrate, the cap comprising a the metal or a metal alloy.
- 13. (Amended) A product as claimed in claim 12, wherein the eap metal or metal alloy is iron, cobalt, nickel, or an alloy of iron, cobalt, or nickel.
- 14. (Amended) A product as claimed in claim 13, wherein the eap metal or metal alloy is nickel.
- 21. (Amended) A product comprising:

 a substrate having a strain point or a melting point temperature
 between about 300°C and 700°C; and

a plurality of substantially aligned carbon nanotubes attached to $\frac{10}{2}$ experiments at a density no greater than 10^2 nanotubes per square millimeter of substrate.

37. (Amended) A product comprising:

a substrate having a strain point or a melting point temperature between about 300°C and 700°C and

one or more carbon nanotubes <u>originating and extending outwardly</u> from an outer surface of the substrate.

78. (Amended) A field emission display comprising:

a baseplate having an electron emitting array positioned thereon, the baseplate comprising a substrate and one or more free-standing carbon nanotubes originating and extending outwardly from an outer surface of the substrate; and

a phosphor coated plate spaced apart from the baseplate so that electrons emitted from the array impinge on the phosphor coating, wherein the baseplate comprises a substrate and either (1) a plurality of substantially aligned carbon nanotubes of a density greater than 10⁴ nanotubes per square millimeter of substrate; (2) a plurality of substantially aligned carbon nanotubes of a density no greater than 10³ nanotubes per square millimeter of a substrate; (3) one or more carbon nanotubes, wherein the substrate has a strain point or melting point temperature between about 300°C and 700°C; (4) a plurality of substantially aligned carbon nanotubes originating and extending outwardly from an outer surface of the substrate; or (5) one or more free-standing carbon nanotubes originating and extending outwardly from an outer surface of the substrate.
